

HOMIQUITY · MORTGAGE CORPORATION

A digital mortgage brokerage that delivers lender-ready files.

Certainty and speed — a complete, standards-valid MISMO 3.4 package, decision-ready on the first pass.

Wholesale-partner briefing · NMLS licensing in progress

THE PROBLEM

The file is a mess — so everyone pays for it

The borrower waits, blind

Days pass with no idea where they stand — anxiety, drop-off, and lost deals.

The lender gets a disorganized packet

Incomplete, non-standard files get bounced back for what's missing — twice.

Everyone re-keys the same data

The same numbers are re-entered by hand at every hand-off, adding errors and delay.

Homiquity's fix

Turn a borrower's raw inputs into one organized, lender-ready package — fast, honest, and compliant — and deliver it straight to a wholesale lender.

WHAT WE ARE

A mortgage broker — the loop is borrower ↔ lender

One sentence: a borrower completes intake → gets an instant, deterministic pre-approval read → their file becomes a standards-valid MISMO package → we deliver it to a wholesale lender.

Agents, listings, and homeowner tools feed or extend the loop — they never sit on the critical path to a funded loan.

THE PIPELINE

From lead to a funded-ready package — end to end

Gated + audited end to end. Submission is blocked until intake, AUS, and the lender package are clean — and every step is captured for the record.

We bring you qualified, consented borrowers

A purpose-built top-of-funnel — persona landing pages, an SEO/content engine, and free decision tools — captures buyers early and hands them into the loop with consent already in hand.

Persona landing pages

First-time buyer, VA, self-employed, refinance

SEO + education engine

Articles, glossary, buying-power tools that rank

Approval Strength + calculators

Nine calculators that turn browsers into applicants

First-time buyer

VA loans

Self-employed

Refinance

A complete, consented application — done right

Consented URLA (Form 1003)

The full application, captured cleanly — with the borrower's consent recorded before anything moves.

TRID clock starts at exactly six pieces

Not a moment sooner or later — the six application elements trigger the timing, correctly, every time.

E-disclosures + e-consent

ESIGN-compliant delivery and consent, tracked and auditable.

AI document coaching — extraction only

AI structures and completes the file. It never decides, and never implies approval or eligibility.

An instant pre-approval read you can trust

**Deterministic.
AI-free.
Auditable.**

Same inputs → same outcome. No black box,
no model deciding who qualifies.

Instant read in one session

Affordability, DTI, and credit-tier math resolve immediately — the borrower knows where they stand.

LLPA-aware pricing

Pricing adjustments computed against agency grids — cited, not guessed.

Ambiguity routes to a human

Edge cases are escalated to staff, never auto-decided by the machine.

Adverse action handled

No adverse action without the required notice — FCRA/ECOA by construction.

A package that's decision-ready on the first pass

MISMO 3.4 / ULDD

Standards-valid output (ULDD Phase 5) — the format your systems ingest.

QM points-and-fees

Points-and-fees and APR-APOR spread pre-flighted against the note-date thresholds.

Anti-steering disclosure

Reg Z §1026.36(e)(3) options presented before anything is locked.

Special Feature Codes

SFCs derived and validated as a set — not hand-typed.

UCD / ULDD / EarlyCheck mirror

We run your delivery edits as a lender's-eye pre-check before you ever see the file.

Complete + consistent

Outstanding-document gating means nothing critical is missing at submission.

Why you care: a clean, standards-valid file underwrites faster and bounces less — lowering your cost per loan.

DU and LPA — findings captured before delivery

Desktop Underwriter (DU)

Fannie Mae

- ✓ Casefile assembled from the verified file
- ✓ DU-12.1-shaped findings captured
- ✓ Day-1-Certainty-style commitment output

Loan Product Advisor (LPA)

Freddie Mac

- ✓ Second agency leg run in parallel
- ✓ Findings reconciled against the DU read
- ✓ Broadens the wholesale channels you can serve

The AUS legs run as deterministic simulations behind production adapters today; they switch to live DU/LPA the day Homiquity is credentialed — the integration seam is already built.

Submission-ready, into your TPO channel

A target shortlist of wholesale partners, a real submission state machine, and a readiness gate that won't let a file go until it's clean.

Target-5 shortlist • DU + LPA channels

SUBMISSION STATUS — TRACKED END TO END

Readiness-gated. Every submission carries a snapshot of what we believed about the file at the moment we sent it — a built-in audit trail for both sides.

Lender shortlist is business-development data; the submission adapter is a deterministic simulation until a signed broker agreement exists.

SEE IT LIVE — REAL PRODUCT

The borrower experience

Persona funnel + free decision tools — consented borrowers, captured early

Instant, deterministic pre-approval read — with the Reg Z anti-steering disclosure

SEE IT LIVE — REAL PRODUCT

The broker's desk

No-Stall pipeline — one-click Export MISMO, submit to lender, lock the rate

The lender-ready file — MISMO 3.4 export, SSN vaulted (last-4), LTV/DTI

Three reasons a lender says yes

Clean files

Standards-valid, pre-flighted packages underwrite faster and bounce less — lower cost per loan, higher pull-through.

Volume

A purpose-built funnel feeds you a steady flow of qualified, consented borrowers you didn't have to source.

Velocity

Certainty and speed compress the path from intake to submission — less fallout, faster funding.

Built compliance-first, not bolted on

Deterministic engine

Auditable decisions; no AI in the lending decision, ever.

PII through a vault

SSNs stored as ciphertext + last-4, decrypted only at the delivery seam.

Audit log everywhere

Every PII touch and file action is recorded for the record.

Fannie-Mae-grounded

MISMO/ULDD terms verified against the official spec — never invented.

Correct NMLS identity

The company identifier prints on the package the day licensing lands.

The package makes no promises

Neutral validation language — no approval or eligibility claims.

Built and validated today — live on credentialing

Working end to end now

Full intake → decision → package → delivery loop

MISMO 3.4 / ULDD-valid export

Deterministic underwriting + dual-AUS legs

Compliance engines (QM, SFC, edit mirror)

Every vendor call runs behind a production adapter

What makes it live

NMLS licensing — in progress (the long-lead item)

A signed broker agreement with your channel

One adapter swap per vendor (credit, DU/LPA, AVM)

Ops keys (email, storage) — a day of setup

Every integration seam is already in place — going live is configuration, not a rebuild.

THE ASK

Credential us on your TPO channel.

The platform is built and validated. We're completing licensing now. Let's set up a live pilot the day it clears — and prove first-pass, standards-valid delivery on real files.

Homiquity Mortgage Corporation

[Founder name — TODO]

support@homiquity.com • [phone — TODO] • homiquity.com

Veteran-founded

Confidential — for prospective wholesale-lender partners.

NMLS # prints here once issued.

Under the hood — architecture & compliance base

Adapter architecture

Every external vendor (credit, DU/LPA, AVM, lender submission) sits behind one adapter function — a single, tested seam that flips from simulation to live per contract.

Deterministic core

The underwriting engine is pure and vendor-free: same inputs, same outcome, with typed error classification.

Fannie Mae reference base

MISMO 3.4 / ULDD Phase 5, UCD, Special Feature Codes and edit codes are grounded in the official spec set — terminology is verified, never invented.

NMLS reference base

Licensing logic is grounded in the NMLS Policy Guidebook and SAFE-Act mapping — state law controls, discrepancies escalate.
